SUMMER – 2019 EXAMINATION MODEL ANSWER

Subject: Programming in C Subject Code: 22226

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

SUMMER – 2019 EXAMINATION MODEL ANSWER

		example. (Note: Code snippet shall be considered)	
	Ans.	The pointer arithmetic is done as per the data type of the pointer. The	
		basic operations on pointers are	
		Increment: It is used to increment the pointer. Each time a pointer is incremented, it points to the next location with respect to memory size.	
		Example, If ptr is an integer pointer stored at address 1000,then ptr++ shows 1002 as incremented location for an int.It increments by two locations as it requires two bytes storage.	Each operatio
		Decrement: It is used to decrement the pointer. Each time a pointer is decremented, it points to the previous location with respect to memory size. Example,	n with example IM
		If the current position of pointer is 1002, then decrement operation ptr results in the pointer pointing to the location 1000 in case of integer pointer as it require two bytes storage.	
		Addition When addition operation is performed on pointer, it gives the location incremented by the added value according to data type. Eg:	
		If ptr is an integer pointer stored at address 1000, Then ptr+2 shows 1000+(2*2) = 1004 as incremented location for an int.	
		Subtraction When subtraction operation is performed on the pointer variable, it gives the location decremented by the subtracted value according to data type. Eg:	
		If ptr is an integer pointer stored at address 1004, Then ptr-2 shows 1004-(2*2) = 1000 as decremented location for an int.	40.4

SUMMER – 2019 EXAMINATION MODEL ANSWER

	,	, g	
		streat() function:	
		In C programming, streat() concatenates (joins) two strings. It	
		concatenates source string at the end of destination string.	
		Syntax:	
		strcat(destinationsource, source string);	
		Example: Consider str1="abc" and str2="def"	
		strcat(str1,str2); returns abcdef in str1 and str2 remains unchanged.	
		sucat(su1,su2), returns about in su1 and su2 remains unchanged.	
		strcpy() function	
		strncpy() function copies portion of contents of one string into	
		another string.	
		Syntax:	
		strncpy(destination string, source string, size);	
		Example:	
		Consider str1="abc"	
		strcpy(str1,str2); returns abcstr2	
		stremp() function	
		The strcmp function compares two strings which are passed as	
		arguments to it. If the	
		strings are equal then function returns value 0 and if they are not	
		equal the function	
		returns some numeric value.	
		Syntax:	
		strcmp(str1, str2);	
		Example: Consider str1="abc" and str2="abc"	
		Then strcmp(str1,str2) returns 0 as both the strings are same.

SUMMER – 2019 EXAMINATION MODEL ANSWER

Subject: Programming in C Subject Code: 22226

Documentation section: The documentation section consists of a set of comment lines giving the name of the program, the author and other details, which the programmer would like to use later.

Link section: The link section provides instructions to the compiler to link functions from the system library such as using the #include directive.

Correct descripti on of structur e 3M

Definition section: The definition section defines all symbolic constants such using the #define directive.

Global declaration section: There are some variables that are used in more than one function. Such variables are called global variables and are declared in the global declaration section that is outside of all the functions.

Declaration part: The declaration part declares all the variables used in the executable part.

Subprogram section: If the program is a multi-function program then the subprogram section contains all the user-defined functions that are called in the main () function. User-defined functions are generally placed immediately after the main () function, although they may appear in any order.

Header files

A header file is a file with extension .h which contains C function declarations and macro definitions to be shared between several source files.

Include Syntax

Both the user and the system header files are included using the preprocessing directive #include.

'main' function

main() function is the entry point of any C program. It is the point at which execution of program is started. Every C program have a main() function.

	}	
(c)	Enlist different format specifiers with its use.	6M
Ans.	Format specifier tells the compiler what type of data a variable holds	
	during taking input and printing output using scanf() and printf()	
	functions respectively.	
	Format specifiers used in C programming:	
		l

(Autonomous) (ISO/IEC - 27001 - 2005 Certified)

SUMMER – 2019 EXAMINATION MODEL ANSWER

Format	Use
specifier	
%d	Specify data type as short signed
%u	Specify data type as short unsigned
%ld	Specify data type as long singed
%lu	Specify data type as long unsigned
%X	Specify data type as unsigned hexadecimal
%o	Specify data type as unsigned octal
%f	Specify data type as float
%lf	Specify data type as double
%Lf	Specify data type as long double
%с	Specify data type as signed character
%s	Specify data type as unsigned group of
	characters(Strings)
